DETAILED ACTION

Reasons for Allowance

Claims 3-4, 7-8 and 10-11 have been cancelled.

Claims 1-2, 5-6, 9 and 12-14 are allowable.

Consider **claim 1**, the best prior art of record found during the examination of the present application, **Hayama et al (US 7,006,484)** in view of **Davidson et al. (US 6,483,820 B1; hereinafter Davidson)**, fails to specifically disclose, teach, or suggest a mobile communication system comprising: a holding unit configured to hold layered data and a corresponding radio resource amount indicating at least one of a number of channels, a number of multiplexed codes or a transmission power required for transmitting the layered data; a determination unit configured to compare area resource information indicating at least one of an available number of channels, an available number of multiplexed codes or an available transmission power for respective radio areas covered by base stations with the radio resource amount held in the holding unit for each of a plurality of layers of the layered data, and to determine, from layered data of a highest layer, at least one layered data of which the radio resource held in the holding unit satisfies the area resource information; and a radio transmitter configured to transmit the at least one layered data determined by the determination unit from the base station to the mobile stations.

Consider **claim 2**, the best prior art of record found during the examination of the present application, **Hayama et al (US 7,006,484)** in view of **Davidson et al. (US 6,483,820 B1;**

hereinafter Davidson), fails to specifically disclose, teach, or suggest a holding unit configured to hold layered data and a corresponding radio resource amount indicating at least one of a number of channels, a number of multiplexed codes or a transmission power required for transmitting the layered data; a determination unit configured to compare area resource information indicating at least one of an available number of channels, an available number of multiplexed codes or an available transmission power for respective radio areas covered by base stations with the radio resource amount held in the holding unit for each of a plurality of layers of the layered data, and to determine, from layered data of a highest layer, at least one layered data of which the radio resource hold in the holding unit satisfies the area resource information; and a data transmitter configured to transmit the at least one layered data determination by the determination unit to the respective base stations.

Claims 5 and 13 are allowable because it is dependent upon independent claim 2.

Consider **claim 6**, the best prior art of record found during the examination of the present application, **Hayama et al (US 7,006,484)** in view of **Davidson et al. (US 6,483,820 B1; hereinafter Davidson)**, fails to specifically disclose, teach, or suggest a holding unit configured to hold layered data and a corresponding resource amount indicating at least one of a number of channels, a number of multiplexed codes or a transmission power required for transmitting the layered data; a determination unit configured to compare area resource information indicating at least one of an available number of channels, an available number of multiplexed codes or an available transmission power for respective radio areas covered by the base station with the

resource amount held in the holding unit for each of a plurality of layers of the layered data, and to determine, from layered data of a highest layer, at least one layered data of which the resource amount held in the holding unit satisfies the area resource information; and a radio transmitter configured to transmit the at least one layered data determined by the determination unit to the mobile stations.

Claims 9 and 14 are allowable because it is dependent upon independent claim 6.

Consider **claim 9**, the best prior art of record found during the examination of the present application, **Hayama et al (US 7,006,484)** in view of **Davidson et al. (US 6,483,820 B1; hereinafter Davidson)**, fails to specifically disclose, teach, or suggest a communication method used in a mobile communication system which comprises a holding unit configured to hold layered data and a corresponding radio resource amount indicating at least one of a number of channels, a number of multiplexed codes or a transmission power required for transmitting the layered data, the communication method comprising: comparing area resource information indicating at least one of an available number of channels, an available number of multiplexed codes or an available transmission power for respective radio areas covered by base stations with the radio resource amount held in the holding unit for each of a plurality of layers of the layered data, and determining, from layered data of a highest layer, at least one layered data of which the radio resource amount held in the holding unit satisfies the area resource information; and transmitting the at least one layered data determined in the determining step to the mobile stations.
